Biographies in the History of Physics

2020-07-22 Christian Forstner This book sheds new light on the biographical approach in the history of physics by including the biographies of scientific objects, institutions, and concepts. What is a biography? Can biographies also be written for non-human subjects like scientific instruments, institutions or concepts? The respective chapters of this book discuss these controversial questions using examples from the history of physics. By approaching biography as metaphor, it transcends the boundaries between various perspectives on the history of physics, and enriches our grasp of the past.

The Remnants of Race Science

2023-08-29 Sebastián Gil-Riaño After World War II, UNESCO launched an ambitious international campaign against race prejudice. Casting racism as a problem of ignorance, it sought to reduce prejudice by spreading the latest scientific knowledge about human diversity to instill “mutual understanding” between groups of people. This campaign has often been understood as a response led by British and U.S. scientists to the extreme ideas that informed Nazi Germany. Yet many of its key figures were social scientists either raised in or closely involved with South America and the South Pacific. *The Remnants of Race Science* traces the influence of ideas from the Global South on UNESCO's race campaign, illuminating its relationship to notions of modernization and economic development. Sebastián Gil-Riaño examines the campaign participants' involvement in some of the most ambitious development projects of the postwar period. In challenging race prejudice, these experts drew on ideas about race that emphasized plasticity and mutability, in contrast to the fixed categories of scientific racism. Gil-Riaño argues that these same ideas legitimated projects of economic development and social integration aimed at bringing ostensibly “backward” indigenous and non-European peoples into the modern world. He also shows how these experts' promotion of studies of race relations inadvertently spurred a deeper reckoning with the structural and imperial sources of racism as well as the aftermath of the transatlantic slave trade. Shedding new light on the postwar refashioning of ideas about race, this book reveals how internationalist efforts to dismantle racism paved the way for postcolonial modernization projects.

Graphic Science

2017-10-17 Darryl Cunningham 'Darryl Cunningham's simplicity of style is deceptive. I never fail to learn from his work, always educational and deeply human too. This is the sort of book you think you have bought for your child, then refuse to give up until you have finished it first. Buy two copies to be on the safe side.'— Robin Ince Much is known about scientists such as Darwin, Newton, and Einstein, but what about lesser-known scientists—people who have not achieved a high level of fame, but who have contributed greatly to human knowledge? What were their lives like? What were their struggles, aims, successes, and failures? How do their discoveries fit into the bigger picture of science as a whole? Overlooked, sidelined, excluded, discredited: key figures in scientific discovery come and take their bow in an alternative Nobel Prize gallery in a colourful graphic novel by Darryl Cunningham. Antoine Lavoisier: the father of French chemistry who gave oxygen its name, Lavoisier was a wealthy man who found himself on the wrong side of a revolution and paid the price with his life. The contribution to his work by his wife Marie-Anne Lavoisier is only now being fully recognised. Mary Anning: a poor, working-class woman who made her living fossil-hunting along the beach cliffs of southern England. Anning found herself excluded from the scientific community because of her gender and social class. Wealthy, male, experts took credit for her discoveries. George Washington Carver: born a slave, Carver become one of the most prominent botanists of his time, as well as a teacher at the Tuskegee Institute. Carver devised over 100 products using one major ingredient—the peanut—including dyes, plastics and gasoline. Alfred Wegener: a German meteorologist, balloonist, and arctic explorer, his theory of continental drift was derided by other scientists and was only accepted into mainstream thinking after his death. He died

in Greenland on an expedition, his body lost in the ice and snow. Nikola Tesla: a Serbian American inventor, electrical engineer, mechanical engineer, physicist, and futurist best known for his contributions to the design of the modern alternating current (AC) electricity supply system. A competitor of Edison, Tesla died in poverty despite his intellectual brilliance. Jocelyn Bell Burnell: a Northern Irish astrophysicist. As a postgraduate student, she discovered the first radio pulsars (supernova remnants) while studying and advised by her thesis supervisor Antony Hewish, for which Hewish shared the Nobel Prize in physics while Bell Burnell was excluded. Fred Hoyle: an English astronomer noted primarily for the theory of stellar nucleosynthesis - the process whereby most of the elements on the Periodic Table are created. He was also noted for the controversial positions he held on a wide range of scientific issues, often in direct opposition to prevailing theories. This eccentric approach contributed to him to being overlooked by the Nobel Prize committee for his stellar nucleosynthesis work. Any one of these figures could have been awarded a Nobel prize. Not every scientific discoverer was lauded in their time, for reasons of gender, race, or lack of wealth, or (in the case of Lavoisier) being too wealthy: in the 21st century, there are many more reparations and reputations to be made.

Objectivity in Science

2015-03-23 Flavia Padovani This highly multidisciplinary collection discusses an increasingly important topic among scholars in science and technology studies: objectivity in science. It features eleven essays on scientific objectivity from a variety of perspectives, including philosophy of science, history of science, and feminist philosophy. Topics addressed in the book include the nature and value of scientific objectivity, the history of objectivity, and objectivity in scientific journals and communities. Taken individually, the essays supply new methodological tools for theorizing what is valuable in the pursuit of objective knowledge and for investigating its history. The essays offer many starting points, while suggesting new avenues of research. Taken collectively, the essays exemplify the very virtues of objectivity that they theorize—in reading them together, the reader can sense various anxieties about the dangerously subjective in our age and locate commonalities of concern as well as differences of approach. As a result, the volume offers an expansive vision of a research community seeking a communal understanding of its own methods and its own epistemic anxieties, struggling to enunciate the key problems of knowledge of our time and offer insight into how to overcome them.

Objectivity

2021-02-02 Lorraine Daston Objectivity has a history, and it is full of surprises. In *Objectivity*, Lorraine Daston and Peter Galison chart the emergence of objectivity in the mid-nineteenth-century sciences — and show how the concept differs from alternatives, truth-to-nature and trained judgment. This is a story of lofty epistemic ideals fused with workaday practices in the making of scientific images. From the eighteenth through the early twenty-first centuries, the images that reveal the deepest commitments of the empirical sciences — from anatomy to crystallography — are those featured in scientific atlases: the compendia that teach practitioners of a discipline what is worth looking at and how to look at it. Atlas images define the working objects of the sciences of the eye: snowflakes, galaxies, skeletons, even elementary particles. Galison and Daston use atlas images to uncover a hidden history of scientific objectivity and its rivals. Whether an atlas maker idealizes an image to capture the essentials in the name of truth-to-nature or refuses to erase even the most incidental detail in the name of objectivity or highlights patterns in the name of trained judgment is a decision enforced by an ethos as well as by an epistemology. As Daston and Galison argue, atlases shape the subjects as well as the objects of science. To pursue objectivity — or truth-to-nature or trained judgment — is simultaneously to cultivate a distinctive scientific self wherein knowing and knower converge. Moreover, the very point at which they visibly converge is in the very act of seeing not as a separate individual but as a member of a particular scientific community. Embedded in the atlas image, therefore, are the traces of consequential choices about knowledge, persona, and collective sight. *Objectivity* is a book addressed to any one interested in the elusive and crucial notion of objectivity — and in what it means to peer into the world scientifically.

Isaac Newton

2008-10-16 Kathleen Krull What was Isaac Newton like? Secretive, vindictive, withdrawn, obsessive, and, oh, yes, brilliant. His imagination was so large that, just "by thinking on it," he invented calculus and figured out the scientific explanation of gravity. Yet Newton was so small-minded that he set out to destroy other scientists who dared question his findings. Here is a compelling portrait of Newton, contradictions and all, that places him against the backdrop of 17th-century England, a time of plague, the Great Fire of London, and two revolutions.

Models

2004 Soraya de Chadarevian Now that '3-D models' are so often digital displays on flat screens, it is timely to look back at the solid models that were once the third dimension of science. This book is about wooden ships and plastic molecules, wax bodies and a perspex economy, monuments in cork and mathematics in plaster, casts of diseases, habitat dioramas, and extinct monsters rebuilt in bricks and mortar. These remarkable artefacts were fixtures of laboratories and lecture halls, studios and workshops, dockyards and museums. Considering such objects together for the first time, this interdisciplinary volume demonstrates how, in research as well as in teaching, 3-D models played major roles in making knowledge. Accessible and original chapters by leading scholars highlight the special properties of models, explore the interplay between representation in two dimensions and three, and investigate the shift to modelling with computers. The book is fascinating reading for anyone interested in the sciences, medicine, and technology, and in collections and museums.

Henri Poincaré

2022-12-13 Jeremy Gray A comprehensive look at the mathematics, physics, and philosophy of Henri Poincaré Henri Poincaré (1854-1912) was not just one of the most inventive, versatile, and productive mathematicians of all time—he was also a leading physicist who almost won a Nobel Prize for physics and a prominent philosopher of science whose fresh and surprising essays are still in print a century later. The first in-depth and comprehensive look at his many accomplishments, Henri Poincaré explores all the fields that Poincaré touched, the debates sparked by his original investigations, and how his discoveries still contribute to society today. Math historian Jeremy Gray shows that Poincaré's influence was wide-ranging and permanent. His novel interpretation of non-Euclidean geometry challenged contemporary ideas about space, stirred heated discussion, and led to flourishing research. His work in topology began the modern study of the subject, recently highlighted by the successful resolution of the famous Poincaré conjecture. And Poincaré's reformulation of celestial mechanics and discovery of chaotic motion started the modern theory of dynamical systems. In physics, his insights on the Lorentz group preceded Einstein's, and he was the first to indicate that space and time might be fundamentally atomic. Poincaré the public intellectual did not shy away from scientific controversy, and he defended mathematics against the attacks of logicians such as Bertrand Russell, opposed the views of Catholic apologists, and served as an expert witness in probability for the notorious Dreyfus case that polarized France. Richly informed by letters and documents, Henri Poincaré demonstrates how one man's work revolutionized math, science, and the greater world.

Isaac Newton

2007-12-18 James Gleick Isaac Newton was born in a stone farmhouse in 1642, fatherless and unwanted by his mother. When he died in London in 1727 he was so renowned he was given a state funeral—an unheard-of honor for a subject whose achievements were in the realm of the intellect. During the years he was an irascible presence at Trinity College, Cambridge, Newton imagined properties of nature and gave them names—mass, gravity, velocity—things our science now takes for granted. Inspired by Aristotle, spurred on by Galileo's discoveries and the philosophy of Descartes, Newton grasped the intangible and dared to take its measure, a leap of the mind unparalleled in his generation. James Gleick, the author of *Chaos and Genius*, and one of the most acclaimed science writers of his generation, brings the reader into Newton's reclusive life and provides startlingly clear explanations of the concepts that changed forever our perception of bodies, rest, and motion—ideas so basic to the twenty-first century, it can truly be said: We are all Newtonians.

Learning about plants and insects helped them discover new medicines and grow better crops. Studying animals taught them how to raise healthy poultry, cattle, and horses for food, farming, and transportation. Today's biologists study everything imaginable. Perspectives on Chemical Biography in the 21st Century

2019-01-14 Isabel Malaquias Overlooked, even despised by historians of chemistry for many years, the genre of biography has enjoyed a revival since the beginning of this century. The key to its renaissance is the use of the biographical form to provide a contextual analysis of important themes in contrast to the uncritical, almost hagiographic, lives of chemists written in the earlier part of the twentieth century. Bringing together the contributions of scholars active in several different countries, *Perspectives on Chemical Biography in the 21st Century* leads the reader through emerging questions around sources, and the generic problems faced by authors of biographies, before moving on to discuss aspects more related with physical, theoretical and inorganic chemistry, and facets of 19th century chemistry. In contrast to the letters and diaries of earlier chemists, we are now faced with scientists who communicate by telephone and email, and compose their documents on computers. Are we facing a modern equivalent of the destruction of the Library of Alexandria where all our sources are wiped out electronically?

Things in Motion

2015 Rosemary A. Joyce "The contributors to *Things in Motion*, collectively, demonstrate the dynamic capacity of things in motion, from the point where things emerge from source material, to their circulation in the contemporary world, including their extended circulation through reproduction in other media. The various chapters show that examining the itineraries of things multiplies the assemblages things form and multiplies the sites at which we can recognize things in motion. None of the things discussed seem to ever have died. Their itineraries are continued by their movement in and out of museums and curation facilities, where many of them have come to rest temporarily, the circulation of their images, and their adaptation in sometimes unexpected contemporary material culture. Their itineraries also include the scholarship about them, to which this volume contributes, making it another site assembled by these active things"--Provided by publisher.

The Universe

2008-01-31 John Gribbin *The Universe: A Biography* makes cosmology accessible to everyone. John Gribbin navigates the latest frontiers of scientific discovery to tell us what we really know about the history of the universe. Along the way, he describes how the universe began; what the early universe looked like; how its structure developed; and what emerged to hold it all together. He describes where the elements came from; how stars and galaxies formed; and the story of how life emerged. He even looks to the future: is the history of the universe going to end with a Big Crunch or a Big Rip?

The History of Physics

2008 Howard T. Milhorn The history of physics ranges from antiquity to modern string theory. Since early times, human beings have sought to understand the workings of nature--why unsupported objects drop to the ground, why different materials have different properties, and so forth. The emergence of physics as a science, distinct from natural philosophy, began with the scientific revolution of the 16th and 17th centuries when the scientific method came into vogue. Speculation was no longer acceptable; research was required. The beginning of the 20th century marks the start of a more modern physics. Physicists began to study the atom,

with its electrons and its nucleus. Then they began to look at the fundamental question of the forces that hold the nucleus together and the particles that account for the natural forces. This book approaches the history of physics from a biographical point of view, considering people to be more interesting than things, and the combination of the two more interesting than the sum of the individual parts. After a brief overview of classical and modern physics, 336 one-page biographies of individuals who have made significant contributions to the field of physics are presented.

Forbidden Science

1992 Jacques Vallee Known principally as an investigator of the UFO phenomenon and a science fiction novelist, the French-born Vallee (now a resident of the U.S.) has also worked as a computer scientist in both academia and industry. UFOlogists will not find the answers to all of their questions here, for although Vallee believes that UFOs exist, he has no idea just what they are. Therein lies the excellence of his dazzling diary: it offers a glimpse into the mind of a scientist who seems to challenge every preconception and established piety. To his academic training as a mathematician and scientist, which stressed rational approaches to problems, Vallee has brought an interest in the mystical, the psychical, and the paranormal. He has been a Rosicrucian and has studied the works of ancient scientists like Paracelsus. His diary is replete with profoundly insightful, often devastating observations about the strengths and weaknesses of France and the U.S., their academics and their researchers in industry.

And Darwin of course discovered the principle by which new species are formed, but his bold curiosity extended to the dinner table as well. (And how many people can say they've eaten an owl!) In Eureka! John Grant - author of Debunk It!, Discarded Science, Spooky Science and many others - offers fifty vivid portraits of groundbreaking scientists. From lutes and owls to astronomy and evolution, Eureka! explains how these scientific geniuses have shaped our understanding - and how they spent their free time as well.

Biographies of Distinguished Scientific Men (Classic Reprint)

2018-01-15 François Arago Excerpt from Biographies of Distinguished Scientific Men On one occasion these warlike tastes had nearly cost me dear. It was the night of the battle of feires-tortes. The Spanish troops in their retreat had partly mistaken their road. I was in the square of the village before daybreak: I saw a brigadier and five troopers come up, who, at the sight of the tree of liberty, called out, Somos perdidos I I ran immediately to the house to arm myself with a lance which had been left there by a soldier of the leve'e en masse, and placing myself in ambush at the corner of a street, I struck with a blow of this weapon the brigadier placed at the head of the party. The wound was not dangerous: a cut of the sabre, however, was descending to punish my hardihood, when some countrymen came to my aid, and, armed with forks, overturned the five cavaliers from their saddles, and made them prisoners. I was then seven years old.* My father having gone to reside at Perpignan, as treasurer of the mint, all the family quitted Estagel to follow him there. I was then placed as an outdoor pupil at the municipal college of the town, where I occupied myself almost exclusively with my lite rary studies. Our classic authors had become the objects of my favourite reading. But the direction of my ideas became changed all at once by a singular circumstance which I will relate. Women in Advertisements

Featuring a female model in advertisements initially started with advertisements on products like alcohol and adult entertainment. The trend then spread like a wildfire in the market and is still being widely used although being exaggerated. It has become a compulsion now to have a beautiful model in all kinds of advertisement, which sometimes seems unnecessary. They seem to sell anything from shaving gel to cars. Many women right activists say that the women are being projected as merely an object by such advertisements. But the harsh truth is that advertisements featuring women is influencing viewers of all ages and advertisers have realized this. The advertisement starts with an attractive woman posing in seductive ways followed by the product or the service offered by the company. The beauty of the model already lures the customer, so advertisers do not have to put in more effort to motivate them.

The Best Biographies Of Scientific Objects ~But there are certain drawbacks in using women models in some advertisements and if a consumer is smart enough, it won't take time for him to realize that. It is totally irrelevant to feature a female model or an actress in advertisement promoting men products. Some good examples of this point are showing a woman in axe deodorant commercial and comparison of a partially nude woman's body to the body of a car. Second drawback is due to more concentration on the model, the attention deserved by the product is not sufficient. The main focus of the advertisement is lost. Surprisingly only few male models advertises for male oriented products. Even a picture of a woman on an Internet commercial seems not logical to some extent, as there are thirty percent of female internet users and seventy percent of male internet users, worldwide. To add to it, advertisers cannot explain why beautiful bodies bring success to advertisement.

Advertisements are convincing and motivating tool, which can leave a deep impact on the minds of the viewers and plays a major role in molding the culture and attitude of the people. Expansive and extensive portraying of women in this manner merely reduces their image to an object of passion. Emphasis is laid only on the physical beauty of the woman like features, body curves. After the commercial has been shot, using graphical technology, any kind of imperfection of the body is altered which in a way sends out the signal that only perfect people are meant to use the product.
